

## Kendo grid update datasource manually

I'm not robot!

answered on 25 Oct 2016, 03:00 PM The configuration used when the data source saves updated data items. Those are data items whose fields have been updated. The data source uses jQuery.ajax to make an HTTP request to the remote service. The value configured via transport.update is passed to jQuery.ajax. This means that you can set all options supported by jQuery.ajax via transport.update except the success and error callback functions which are used by the transport. If the value of transport.update is a function, the data source invokes that function instead of jQuery.ajax. If the value of transport.update is a string, the data source uses this string as the URL of the remote service. All transport actions (read, update, create, destroy) must be defined in the same way, that is, as functions or as objects. Mixing the different configuration alternatives is not possible. Example - specify update as a string var dataSource = new kendo.data.DataSource({ transport: { read: { url: " ", dataType: "jsonp" // "jsonp" is required for cross-domain requests; use "json" for same-domain requests }, update: { url: " ", dataType: "jsonp" // "jsonp" is required for cross-domain requests; use "json" for same-domain requests } }, schema: { model: { id: "ProductID" } } }); dataSource.fetch(function() { var product = dataSource.at(0); product.set("UnitPrice", 20); dataSource.sync(); //makes request to }); Example - specify update as a function var dataSource = new kendo.data.DataSource({ transport: { read: function(options) { /\* implementation omitted for brevity \*/ }, update: function(options) { /\* make JSONP request to \$.ajax({ url: " ", dataType: "jsonp", // "jsonp" is required for cross-domain requests; use "json" for same-domain requests // send the updated data items as the "models" service parameter encoded in JSON data: { models: kendo.stringify(options.data.models) }, success: function(result) { // notify the data source that the request succeeded options.success(result); }, error: function(result) { // notify the data source that the request failed options.error(result); } }); } }, batch: true, schema: { model: { id: "ProductID" } } }); dataSource.fetch(function() { var product = dataSource.at(0); product.set("UnitPrice", 20); dataSource.sync(); //makes request to }); If set to false, the request result will not be cached by the browser. Setting cache to false will only work correctly with HEAD and GET requests. It works by appending " = {timestamp}" to the GET parameters. By default, "jsonp" requests are not cached. Refer to the jQuery.ajax documentation for further information. Example - enable request caching var dataSource = new kendo.data.DataSource({ transport: { update: { /\* omitted for brevity \*/ cache: true } } }); transport.update.contentType String The content-type HTTP header sent to the server. Defaults to "application/x-www-form-urlencoded". Use "application/json" if the content is JSON. Refer to the jQuery.ajax documentation for further information. Example - set content type var dataSource = new kendo.data.DataSource({ transport: { update: { /\* omitted for brevity \*/ contentType: "application/json" } } }); Additional parameters which are sent to the remote service. The parameter names must not match reserved words, which are used by the Kendo UI DataSource for sorting, filtering, paging, and grouping. Refer to the jQuery.ajax documentation for further information. Example - send additional parameters as an object var dataSource = new kendo.data.DataSource({ transport: { update: { /\* omitted for brevity \*/ data: { name: "Jane Doe", age: 30 } } } }); Example - send additional parameters by returning them from a function var dataSource = new kendo.data.DataSource({ transport: { update: { /\* omitted for brevity \*/ data: function() { return { name: "Jane Doe", age: 30 } } } }); The type of result expected from the server. Commonly used values are "json" and "jsonp". Refer to the jQuery.ajax documentation for further information. Example - set the data type to JSON var dataSource = new kendo.data.DataSource({ transport: { update: { /\* omitted for brevity \*/ dataType: "json" } } }); The type of request to make ("POST", "GET", "PUT" or "DELETE"). The default request is "GET". The type option is ignored if dataType is set to "jsonp". JSONP always uses GET requests. Refer to the jQuery.ajax documentation for further information. Example - set the HTTP verb of the request var dataSource = new kendo.data.DataSource({ transport: { update: { /\* omitted for brevity \*/ type: "POST" } } }); The URL to which the request is sent. If set to a function, the data source will invoke it and use the result as the URL. Example - specify URL as a string var dataSource = new kendo.data.DataSource({ transport: { read: { url: " ", dataType: "jsonp" // "jsonp" is required for cross-domain requests; use "json" for same-domain requests }, update: { url: " ", dataType: "jsonp" // "jsonp" is required for cross-domain requests; use "json" for same-domain requests } }, schema: { model: { id: "ProductID" } } }); dataSource.fetch(function() { var product = dataSource.at(0); product.set("UnitPrice", 20); dataSource.sync(); }); Example - specify URL as a function var dataSource = new kendo.data.DataSource({ transport: { read: { url: " ", dataType: "jsonp" // "jsonp" is required for cross-domain requests; use "json" for same-domain requests }, update: { url: function(options) { return " " }, dataType: "jsonp" // "jsonp" is required for cross-domain requests; use "json" for same-domain requests } }, schema: { model: { id: "ProductID" } } }); dataSource.fetch(function() { var product = dataSource.at(0); product.set("UnitPrice", 20); dataSource.sync(); }); dataSource.read(); will do the trick. You can also refresh your grid with sending new parameters to Read action and setting pages to what you like: var ds = \$("#gridName"). What is dataSource in kendo grid? The Kendo UI DataSource component plays a central role in all web applications built with Kendo UI for jQuery. The DataSource is an abstraction for using local data (arrays of JavaScript objects) or remote data (web services returning JSON, JSONP, oData or XML). How do you pass parameters in kendo grid read? Try this: Add this to your grid read function or any CRUD operation: .Read(read => read.Action("ReadCompanyService", "Admin").Data("CompanyServiceFilter")) Add javascript: function CompanyServiceFilter() { return { company: \$("#ServiceCompany").val() } } How do I destroy the Kendo grid? Destroying MVVM-Created Widgets Use the kendo.unbind() method to remove any MVVM bindings related to the widget. Call kendo.destroy() for the appropriate container, or the destroy() method of each widget inside this container. How do I reset my Kendo grid? clear kendo grid in jQuery // RESET KENDO UI GRID. \$("#kendoGrid").data().kendoGrid.destroy(); \$("#kendoGrid").empty(); OR. // RESET KENDO UI GRID. \$("#kendoGrid").data("kendoGrid").dataSource.data[[]]; How do I get all the rows in kendo grid? Solution Save the current page size in a global variable by using the pageSize method of the Kendo UI dataSource. Show all the rows on a single page by using the pageSize method. Select all the rows by using the select method of the Kendo UI Grid. Bring back the old page size by using the pageSize method. How do you clear a kendo grid? Can I use Kendo UI for free? Telerik Kendo UI Core is the free and open-source (Apache 2.0) version of Kendo UI. Kendo UI Core can be used in open source and commercial projects which don't require dedicated support or advanced widgets such as editor, chart, grid, scheduler and more. You can access its public github repository here. How do I set pagination in kendo grid? To enable paging: Set the pageable, pageSize, and skip options of the Grid. Handle the emitted pageChange event. Manually paginate the data. How do I destroy kendo tooltip? For example, to destroy a grid you do the following: \$("#grid").data("kendoGrid").destroy(); How do you destroy a grid? Using a How does DataSource work with Kendo UI widgets? However, it must be combined with some user interface or another Kendo UI widget such as the Grid, ListView, etc. Though the examples below use the Grid as a sample, the configurations apply to any other widget or scenario. The DataSource component can work with local data or remote data. Why do we need kendo grid widget for Query? In numerous scenarios there's a requirement not only to visualize data in a table structure, but to have the ability to manipulate this data and save changes. The Kendo UI grid widget supports data editing operations (create, update, destroy) via a simple configuration of its data source. How are CRUD operations managed in Kendo UI? Setting the Transport. The DataSource component can work with local data or remote data. In both cases, the CRUD operations are managed by the transport configuration of the DataSource. transport is a JavaScript object that can be configured to execute predefined functions or make requests to predefined URLs on certain events. What happens when batch is disabled in Kendo UI? When batch is disabled, as it is by default, and only one data item can be updated at a time, the updated data item is received as an object in e.data. If batch is enabled and multiple data items can be updated, they are received as an array of objects in e.data.models.
